

Pricing Tables

Installation, everyday use and support
Version 1.0.1

What this plugin does

Build a clear comparison of plans, packages or services inside WordPress. Edit plan names, prices, descriptions, included/excluded features, badges, link buttons and colors. Display the published table on a page with a shortcode.

What it does not do

It does not take payments, manage subscriptions or memberships, calculate tax, synchronize store prices, or provide an AI service. A button follows the link you enter. Keep displayed prices consistent with the destination page.

Before installation

You need a WordPress Administrator account and permission to install plugins. The plugin requires WordPress 6.5+ and PHP 8.2+. This release was tested on WordPress 7.1.1 with PHP 8.4.25 and the Twenty Twenty-Five theme. Other versions, multisite and page builders are not certified by these tests. Back up your site and try the plugin on staging first.

Install or update

1. Download the **installable plugin ZIP**, not the owner handoff bundle.
2. In WordPress, open **Plugins > Add Plugin > Upload Plugin**.
3. Select the ZIP and click **Install Now**, then **Activate**.
4. When updating an existing version, choose **Replace current with uploaded** after reviewing the version numbers. Your table records remain in the database.

No activation key, paid API account or page builder is required by this version.

From plans to a page

1. Create and name the table

Open **Pricing Tables > Add New**. Give the table a title for your own organization. Enter a name for every plan you intend to keep. Use **Add plan** for more options.

2. Set the prices and billing labels

Enter a currency label such as \$ or USD, a Price, and Month, Year, One-time or Custom. Custom lets you enter a label such as "per visit". Price fields are display text, not calculations. If Sale price is present, it replaces Price; Regular price appears crossed out alongside it.

3. Explain the differences

Use **Add feature** and mark each feature Included or not included. Choose one highlighted plan, or No highlighted plan. You may add your own badge text. Up/Down reorder plans or features. Remove takes effect after you save.

4. Add the next step

Enter both a **CTA label** (button wording) and a **CTA URL**. URLs must be complete HTTP or HTTPS addresses, for example <https://example.com/contact>. Relative paths, javascript links, mailto and tel links are not accepted. The new-window option adds protective link attributes.

5. Publish and embed

Click **Publish**, then copy the shortcode from the Shortcode box. Add a **Shortcode block** to a page or post, paste the code and publish that page. Example: `[forge_lumina_pricing_table id="123"]`. Replace 123 with your own table ID. If clipboard access is blocked, select and copy the code manually.

Only published, valid tables display. Draft, private and trashed tables stay hidden. A locked password-protected table is also hidden; publish public comparisons without a password.

Make changes confidently

Edit, preview and reuse

Open a table, edit its fields and click **Update**. The Saved preview shows the last saved values. It is not a live preview of unsaved edits. Duplicate, in the table list, creates a draft copy with fresh internal plan IDs. Publish that copy and use its own shortcode.

Style settings

Colors accept a three- or six-digit hex value (#123 or #123456), or blank for defaults. Use colors with readable contrast. Maximum width: 600-1600px; heading size: 14-48px; price size: 16-64px; border radius: 0-32px; plan gap: 8-48px; padding: 8-64px. Plans stack in narrow layouts.

A rejected edit

Read the error message, correct the field and save again. A rejected update retains the previous valid published configuration. Unsaved edits may need to be re-entered after the page reloads. Check the Saved preview and public page before considering a price change complete.

Data, privacy and removal

The plugin stores table content and configuration in your WordPress database. It adds no visitor form, analytics beacon, external API or tracking cookie. Published tables are public information. Linked sites, your host, WordPress and other plugins may have separate data practices.

Deactivation and uninstall retain table records to prevent accidental loss. Reinstall the plugin to manage them again. Use WordPress Trash to hide a table; restore it when needed. Permanent deletion is a separate WordPress action. Include the database and plugin files in your site backups.

License and purchase terms

The plugin code is licensed under GPL-2.0-or-later; the complete license is included in LICENSE.txt. Customer support, refunds and commercial update entitlements follow the terms of your purchase. This guide does not add a lifetime-support promise or service-level guarantee.

Troubleshooting

The table does not appear

Check that the plugin is active, the table is Published, the shortcode ID is correct, and at least one named plan is valid. Check password protection. Clear the relevant page cache after edits. A shortcode block must contain the shortcode itself, without extra formatting.

The menu or button is missing

Use an Administrator account for the Pricing Tables menu. Reactivate the plugin if the menu is missing after installation. A public button needs both its label and a valid absolute HTTP(S) URL.

The table has the wrong appearance

Check your color choices and theme overrides. If styles are absent, test whether cache/minification software has excluded the plugin stylesheet. Use a staging site for compatibility checks. The saved preview and public display use the same component stylesheet, but a theme can still override styles.

Updating or rolling back

Back up first. Install a newer ZIP using WordPress replacement, then check an existing table and its public page. Version 1.0.1 does not change the database schema. Keep your original ZIP and backup. If rollback is necessary, replace the files with the previous ZIP and restore a database backup only if data restoration is actually needed; a database restore can discard newer site changes.

Contact Forge Lumina

Include your order reference, plugin/WordPress/PHP versions, theme name, exact steps and a screenshot. Do not send passwords or full customer databases by email. For sensitive access, agree on a secure support process first.

Release 1.0.1

This maintenance release protects the last valid published table after invalid edits, respects shortcode password protection, styles the saved preview, improves permission checks, adds field bounds and clipboard feedback, and supplies customer documentation.
